

Data Types \ Number \ Conversion

1▶1 Number To String

The **Number to String** node enables the user to convert a numerical value to a string by either typing in a numerical value in the Number field or by attaching a value or a variable node to that port. Then once the conversion is executed, the resulting string can be acquired through the **String** port

Example

In this example, an **Equal Response** response is used to compare the value of Variable1 with the value of Variable2 once the user triggers the object named Activate. The result of the comparison can be acquired through the **Result** port. We have connected this Result port to the **Branch** node, and if the result of the branch is True, the TrueBox will show; if the result is False, the FalseBox will show.
