[+] Capture Picture

The **Capture Picture node** is used to capture an image from a camera within the scene, and the captured image can then be displayed on a 3D object within the scene. This allows the user to take snapshots and show them in the VR environment, such as displaying a captured image on a screen or other surface.

Example

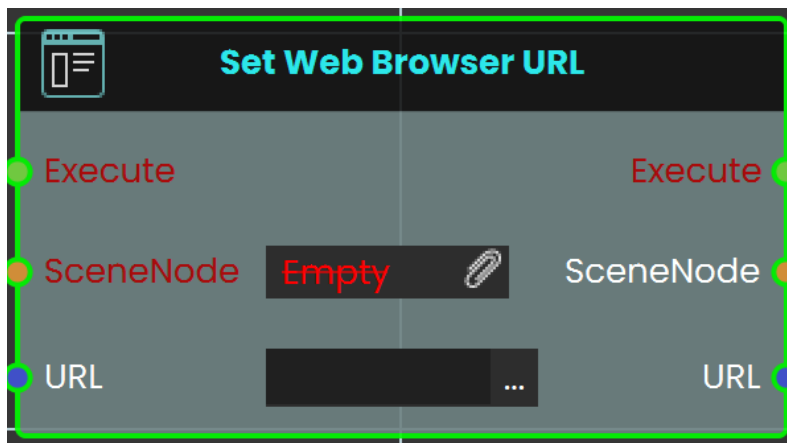

A **Surveillance Monitor** is first created to display the captured images. This monitor is then attached to the VR camera.

In this example, the **Capture Picture Node** is used to capture an image on a picture frame model when the user triggers the Activate event. Before that, the Cast SceneNode is used to identify the picture frame as a 3D object, as the Capture Picture Node only works with 3D objects.

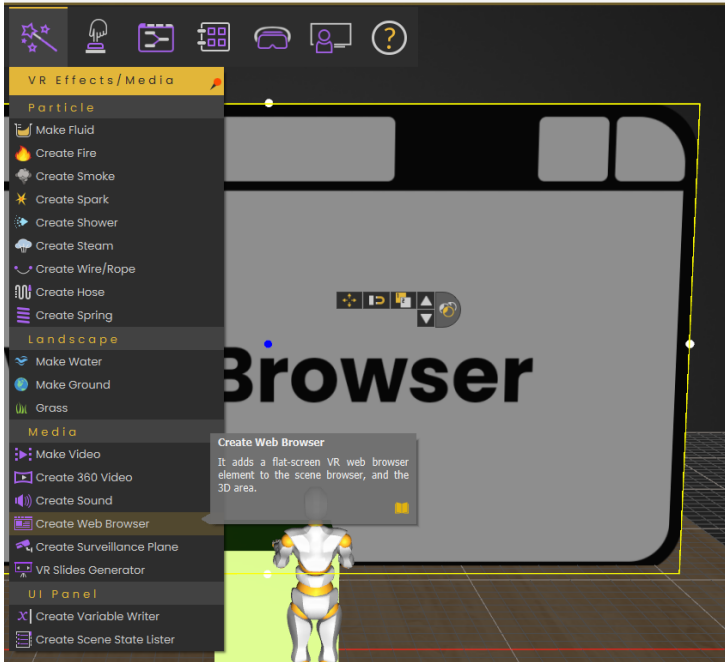

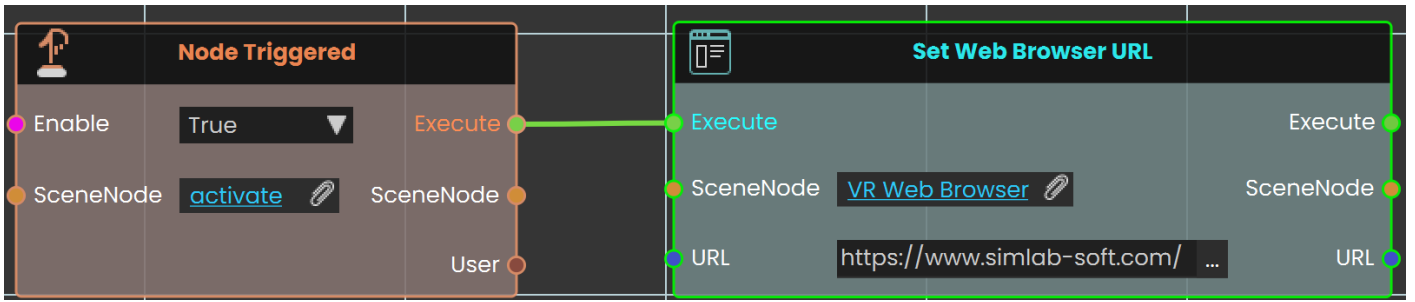

Set Web Browser URL

The **Set Web Browser URL** node sets the URL for a web browser within the VR experience. This node enables users to open and navigate to a specified webpage, making it possible to display web content like videos or instructional resources directly within the VR environment.

□ □ □

Example

In this example, the **Set Web Browser URL** node is used to open the SimLab website. The **Node Triggered** event is activated when the user triggers an object named "activate." As soon as the object is triggered, the **Set Web Browser URL** node is triggered, setting the URL to the SimLab website. The website then loads and is displayed on a web browser plane within the VR environment.
