

Advanced xAPI LRS Settings

By default SimLab Soft will send the evaluation results into its own secured LRS, however If you have setup your own LRS with your LMS, you can configure your experiences to send the results into your own LRS.

How to send results into your own LRS:

- Go to SimLab VR Studio.
- Go to **VR Evaluation > LRS Settings**.

- Choose **custom** LRS settings and **fill** your LRS Authentication information.

The screenshot shows a dialog box titled "xAPI LRS Settings" with a close button (X) in the top right corner. Inside the dialog, there is a section labeled "LRS Settings" with a dropdown menu currently set to "Custom". Below this, there are four input fields: "End Point", "Key", "Secret", and "Authentication". These four fields are grouped together and highlighted with a red rectangular border. At the bottom of the dialog, there are two buttons: "Cancel" and "OK".

After doing so, any VR experience you create should send its result into your LRS system.

By defining Custom LRS settings, It's your responsibility to receive and keep the data on your LMS, SimLab Soft will not save or backup the data anywhere on its VR platform.
